

Plug-In Releases for Microsoft Dynamics MSI

When you first sync to Microsoft Dynamics, you download and install the latest version of the plug-ins for Marketo Sales Insight (MSI). Periodically, Marketo updates these plug-ins, so you can return to the same place to download the new version.

Please [download the latest plug-in](#) corresponding to your Dynamics release.

Note

These versions work for both on-premise and online versions of Dynamics.

Updating your MSI Solution

1. Import the latest version of the solution over the existing version of your Dynamics CRM (ex: if your Dynamics CRM has version 1.4 and the latest version is 1.5, you would import *over*version 1.4).
2. You will see the following pop-up. Select the **Update** and **Overwrite customization** options, then click **Import**.

Import Options Help

! This solution package contains an update for a solution that is already installed.

Solution Action ([Learn more](#))

- Upgrade (recommended)
This option upgrades your solution to the latest version and rolls up all previous patches in one step. Any components associated to the previous solution version that are not in the newer solution version will be deleted.
- Stage for Upgrade
This option upgrades your solution to the higher version, but defers the deletion of the previous version and any related patches until you apply a solution upgrade later.
- Update (not recommended) **1**
This option replaces your solution with this version. Components that are not in the newer solution will not be deleted and will remain in the system.

Previous customizations on components included in this solution ([Learn more](#))

- Maintain customizations (recommended)
This option maintains any unmanaged customizations performed on components, but also implies that some of the updates included in this solution will not take effect.
- Overwrite customizations (not recommended) **2**
This option overwrites or removes any unmanaged customizations previously performed on components in this solution. This option does not affect components that support merge behavior (forms, sitemap, ribbon, app modules). Components that have other managed solutions on top of the existing solution

3

Caution

Selecting Upgrade instead of Update could result in data corruption in your Dynamics environment. **Be sure to choose Update** under Import Options.
